

Experiment No. 4
Implement a program on method and constructor overloading.
Date of Performance:
Date of Submission:

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

Aim: Implement a program on method and constructor overloading.

Objective: To use concept of method overloading in a java program to create a class with same function name with different number of parameters.

Theory:

Method Overloading is a feature that allows a class to have more than one method having the same name, if their argument lists are different. It is similar to constructor overloading in Java, that allows a class to have more than one constructor having different argument lists.

Example: This example to show how method overloading is done by having different number of parameters for the same method name.

Class DisplayOverloading

```
{  
    public void disp(char c)  
    {  
        System.out.println(c);  
    }  
    public void disp(char c, int num)  
    {  
        System.out.println(c + " "+num);  
    }  
}
```

Class Sample

```
{  
    Public static void main(String args[])  
    {  
        DisplayOverloading obj = new DisplayOverloading();  
        Obj.disp('a');  
        Obj.disp('a',10);  
    }  
}
```

Output:

A

A 10

Java supports Constructor Overloading in addition to overloading methods. In Java, overloaded constructor is called based on the parameters specified when a [new](#) is executed.

Sometimes there is a need of initializing an object in different ways. This can be done using constructor overloading.

For example, the Thread class has 8 types of constructors. If we do not want to specify anything about a thread then we can simply use the default constructor of the Thread class, however, if we need to specify the thread name, then we may call the parameterized constructor of the Thread class with a String args like this:

```
Thread t= new Thread (" MyThread ");
```

Code:

```
class Overload2
{
    public static void main(String args[])
    {
        System.out.println(Add.add(5,4));
        System.out.println(Add.add(2.80,3.12,9.00));
    }
}
class Add{
static int add(int a,int b) {return a+b;}
static double add(double a,double b,double c) {return a+b+c;}
}
```

```
Command Prompt

C:\Users\tejashree anand>cd C:\Users\tejashree anand\Desktop\tejashree java program
C:\Users\tejashree anand\Desktop\tejashree java program>javac Overload2.java
C:\Users\tejashree anand\Desktop\tejashree java program>java Overload2.java
9
15.77
C:\Users\tejashree anand\Desktop\tejashree java program>
```

Conclusion:

Comment on how function and constructor overloading used using java
Function and constructor overloading in Java involves creating multiple methods or constructors with the same name within a class but with different parameter lists.

Function Overloading:

Constructor Overloading:

In function overloading, you define multiple methods with the same name in a class but with different parameter lists, including a different number of parameters, different types of parameters, or a combination of both. The Java compiler distinguishes between these methods based on the method's parameter signature

Constructor overloading is similar to function overloading but specifically applies to class constructors. You define multiple constructors within a class with the same name but different parameter lists. This allows objects of the class to be initialized in various ways
