Experiment No. 6
Implement a program on 2D array & strings functions.
Date of Performance:
Date of Submission:

Aim: To use 2D arrays and Strings for solving given problem.

Objective: To use 2D array concept and strings in java to solve real world problem

Theory:

- An array is used to store a fixed-size sequential collection of data of the same type.
- An array can be init in two ways:

1. Initializing at the time of declaration:

```
dataType[] myArray = {value0, value1, ..., valuek};
```

2. Dynamic declaration:

```
dataType[] myArray = new dataType[arraySize];
```

```
myArray[index] = value;
```

- Two – dimensional array is the simplest form of a multidimensional array. Data of only same data type can be stored in a 2D array. Data in a 2D Array is stored in a tabular manner which can be represented as a matrix.
- A 2D Array can be declared in 2 ways:

1. Initializing at the time of declaration:

```
dataType[][] myArray = { {valueR1C1, valueR1C2...}, {valueR2C1, valueR2C2...},...}
```

2. Dynamic declaration:

```
dataType[][] myArray = new dataType[x][y];
```

```
myArray[row_index][column_index] = value;
```

In Java, string is basically an object that represents sequence of char values. An array of characters works same as Java string. **Java String** class provides a lot of methods to perform operations on strings such as `compare()`, `concat()`, `equals()`, `split()`, `length()`, `replace()`, `compareTo()`, `intern()`, `substring()` etc.

1.String literal

To make Java more memory efficient (because no new objects are created if it exists already in the string constant pool).

**Example:**

```
String demoString = "GeeksforGeeks";
```

2. Using new keyword

- `String s = new String("Welcome");`
- In such a case, JVM will create a new string object in normal (non-pool) heap memory and the literal "Welcome" will be placed in the string constant pool.

The variable `s` will refer to the object in the heap (non-pool)

Example:

```
String demoString = new String ("GeeksforGeeks");
```

Code:

```
1}
```

```
class Testarray3{  
    public static void main(String args[]){  
        int arr[][]={{ 1,2,3},{2,4,5},{4,4,5}};  
        for(int i=0;i<3;i++){  
            for(int j=0;j<3;j++){  
                System.out.print(arr[i][j]+" ");  
            }  
            System.out.println();  
        }  
    }  
}
```

```

C:\Users\tejashree anand\Desktop\tejashree java program>javac Testarray3.java
C:\Users\tejashree anand\Desktop\tejashree java program>java Testarray3.java
1 2 3
2 4 5
4 4 5
C:\Users\tejashree anand\Desktop\tejashree java program>
```

2}

```
class StringExample{
public static void main(String args[]){
String s1="java";
char ch[]={'s','t','r','i','n','g','s'};
String s2=new String(ch);
String s3=new String("example");
System.out.println(s2);
System.out.println(s3);
}}
```

```

Conclusion:

Comment on how you have used the concept of string and 2D array.

String Usage: Strings are used to represent sequences of characters in programming. They are widely used for various purposes, including text processing, user input, and data manipulation

2D Array Usage:

```
int arr[][] = {{1,2,3},{2,4,5},{4,4,5}}
```

A 2D array is an array of arrays, providing a convenient way to represent tabular data, matrices, or grids

Both strings and 2D arrays are fundamental data structures in programming and are used in a wide range of applications. Strings are essential for handling textual data, while 2D arrays are useful for storing and processing structured data, especially when you need to work with rows and columns, like in matrices or tables.
