Experiment No.2
Accepting Input Through Keyboard
Date of Performance:
Date of Submission:

Aim: To apply basic programming for accepting input through keyboard.

Objective: To use the facility of java to read data from the keyboard for any program

Theory:

Java brings various Streams with its I/O package that helps the user perform all the Java input-output operations. These streams support all types of objects, data types, characters, files, etc. to fully execute the I/O operations. Input in Java can be with certain methods mentioned below in the article.

Methods to Take Input in Java

There are two ways by which we can take Java input from the user or from a file

1. `BufferedReader` Class
2. `Scanner` Class

Using `BufferedReader` Class for String Input In Java

It is a simple class that is used to read a sequence of characters. It has a simple function that reads a character another `read` which reads, an array of characters, and a `readLine()` function which reads a line.

`InputStreamReader()` is a function that converts the input stream of bytes into a stream of characters so that it can be read as `BufferedReader` expects a stream of characters. `BufferedReader` can throw checked Exceptions.

Using `Scanner` Class for Taking Input in Java

It is an advanced version of `BufferedReader` which was added in later versions of Java. The scanner can read formatted input. It has different functions for different types of data types.

The scanner is much easier to read as we don't have to write throws as there is no exception thrown by it.

It was added in later versions of Java

It contains predefined functions to read an Integer, Character, and other data types as well.

Syntax of Scanner class

Scanner scn = new Scanner(System.in);

Code:

1} Scanner class

```
import java.util.Scanner;

class UserProgram
{
    public static void main(String args[])
    {
        Scanner a = new Scanner(System.in);
        System.out.println("Enter Name , Age and Salary:");
        String str = a.nextLine();
        int age = a.nextInt();
        Double salary = a.nextDouble();
        System.out.println("Name:" + str);
        System.out.println("Age:" + age);
        System.out.println("Salary:" + salary);
    }
}
```

```
Command Prompt
Microsoft Windows [Version 10.0.22000.1936]
(c) Microsoft Corporation. All rights reserved.

C:\Users\tejashree anand>cd C:\Users\tejashree anand\Desktop\tejashree java program
C:\Users\tejashree anand\Desktop\tejashree java program>javac UserProgram.java
C:\Users\tejashree anand\Desktop\tejashree java program>java UserProgram.java
Enter Name , Age and Salary:
TEJASHREE
18
100000
Name:TEJASHREE
Age:18
Salary:100000.0
C:\Users\tejashree anand\Desktop\tejashree java program>
```

2} Buffer reader class

```
package com.javatpoint;
```

```
import java.io.*;
```

```
public class BufferedReaderExample{
```

```
public static void main(String args[])throws Exception{
```

```
    InputStreamReader r=new InputStreamReader(System.in);
```

```
    BufferedReader br=new BufferedReader(r);
```

```
    System.out.println("Enter your name");
```

```
    String name=br.readLine();
```

```
    System.out.println("Welcome "+name);
```

```
}
```

```
}
```

C:\Users\tejashree anand>cd C:\Users\tejashree anand\Desktop\tejashree java program
C:\Users\tejashree anand\Desktop\tejashree java program>javac BufferedReaderExample.java
C:\Users\tejashree anand\Desktop\tejashree java program>java BufferedReaderExample.java
Enter your name
tejashree
Welcome tejashree

C:\Users\tejashree anand\Desktop\tejashree java program>
```

Conclusion:

- 1) Comment on how you have used BufferedReader and Scanner Class for accepting user input

|

BufferedReader:

BufferedReader is part of the java.io package and is primarily used for reading text from character input streams. It's efficient for reading large amounts of text efficiently.

Both BufferedReader and Scanner are commonly used for accepting user input in Java, with BufferedReader being more suitable for reading lines of text, while Scanner is versatile and can handle different types of input more conveniently. The choice between them depends on your specific requirements and the kind of input you need to process. The Scanner class is part of the java.util package and is a more user-friendly way to parse different types of input, such as numbers, strings, and more. Here's an example of accepting user input with Scanner:
